# **Magtek Incorporated**

**TEST REPORT FOR** 

Handheld Secure Pin Entry Device Model: DynaPro Go (300562XX)

**Tested To The Following Standards:** 

FCC Part 15 Subpart C Section(s)

15.207 & 15.225 (13.110-14.010 MHz)

Report No.: 99423-19

Date of issue: November 1, 2017

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

This report contains a total of 36 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc.

## **Test Report Information**

REPORT PREPARED FOR: REPORT PREPARED BY:

Magtek Incorporated Terri Rayle & Joyce Walker 1710 Apollo Court CKC Laboratories, Inc.
Seal Beach, CA 90740 5046 Sierra Pines Drive Mariposa, CA 95338

REPRESENTATIVE: Robert Rodriguez Project Number: 99423

Customer Reference Number: 30004164

**DATE OF EQUIPMENT RECEIPT:** September 14, 2017

DATE(S) OF TESTING: September 14-25 & October 23, 2017

### **Report Authorization**

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm

Director of Quality Assurance & Engineering Services CKC Laboratories, Inc.

### **SUMMARY OF RESULTS**

Standard / Specification: FCC Part 15 Subpart C - 15.225

Test Procedure	Description	Modifications	Results
15.215(c)	Occupied Bandwidth	NA	Pass
15.225(a)-(c)	Field Strength of Fundamental	NA	Pass
15.225(e)	Frequency Stability	NA	Pass
15.225(d)	Field Strength of Spurious Emissions	NA	Pass
15.207	AC Conducted Emissions	NA	Pass

NA = Not Applicable

# **Modifications During Testing**

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions	
No modifications were made during testing.	

Modifications listed above must be incorporated into all production units.

## **Conditions During Testing**

This list is a summary of the conditions noted to the equipment during testing.

<b>Summary of Conditions</b>		
None		

Page 5 of 36 Report No.: 99423-19

### **EQUIPMENT UNDER TEST (EUT)**

The following device/model has been tested by CKC Laboratories: Point of Sale Device, Model: DynaPro Go

Since the time of testing, the manufacturer has chosen to change the device and model name and states that it identical electrically to the one which was tested, or any differences between them do not affect their EMC characteristics, and therefore they meet the level of testing equivalent to the tested device/model.

**Device: Handheld Secure Pin Entry Device** 

Model: DynaPro Go (300562XX)

During testing, numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

#### **Configuration 3**

#### **Equipment Tested:**

Device	Manufacturer	Model #	S/N
Handheld Secure Pin Entry	Magtek Incorporated	DynaPro Go(300562XX)	NA
Device

### 15.225(d) Radiated Emissions & Band Edge

#### Test Setup / Conditions / Data

Test Location: CKC Laboratories, Inc. • 110 N. Olinda Place • Brea, CA 92821 • 714 993 6112

Customer: Magtek Incorporated

Specification: 15.225 Carrier and Spurious Emissions (13.110-14.010 MHz Transmitter)

 Work Order #:
 99423
 Date:
 9/15/2017

 Test Type:
 Radiated Scan
 Time:
 15:57:14

 Tested By:
 E. Wong
 Sequence#:
 4

Software: EMITest 5.03.02

**Equipment Tested:** 

Device Manufacturer Model # S/N
Configuration 3

Support Equipment:

Device Manufacturer Model # S/N
Configuration 3

#### Test Conditions / Notes:

The EUT containing a 13.56 MHz transmitter and single modular approved WiFi transmitter is placed on Styrofoam platform.

WiFi Module FCCID: O7P-362 IC:10147A-362

Evaluation of 13.56MHz transmitter

Frequency range 13.56MHz

The manufacturer declares the highest EUT frequency generated or used, other than the fundamental frequency, is 12MHz

Frequency range of measurement = 9 kHz- 1 GHz.

9kHz -150kHz; RBW=200 Hz, VBW=200 Hz;150kHz-30 MHz; RBW=9kHz,VBW=9kHz;

30MHz-1000 MHz; RBW=120 kHz, VBW=120 kHz.

Test environment conditions:

Temperature: 23°C Relative Humidity: 45% Pressure: 100.8kPa

The EUT is connected to a support laptop via a USB cable with ferrite on the EUT end.

The device is operating at rated 5V DC from the USB port of the laptop, Transmit and receive simultaneously.

Emission profile of the EUT rotated along three orthogonal axis was investigated.

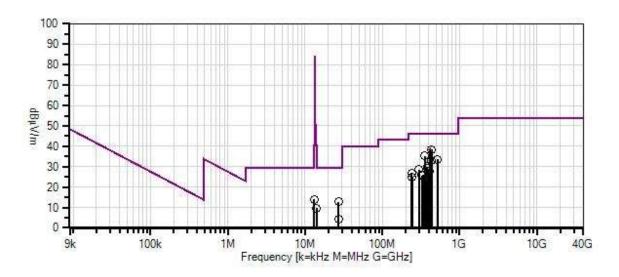

Recorded data represent worse case emission

#### Test Conditions / Notes:

The EUT containing a 13.56 MHz transmitter and single modular approved WiFi transmitter is placed on the test bench.

WiFi Module FCCID: O7P-362 IC:10147A-362

Evaluation of 13.56MHz transmitter

TX Frequency:13.56MHz

The manufacturer declares the highest EUT frequency generated or used, other than the fundamental frequency, is 12MHz

Frequency range of measurement = 150kHz- 30MHz. 150 kHz-30 MHz; RBW=9 kHz, VBW=9kHz

Test environment conditions: 23°C, 45% Relative Humidity, 100.8kPa

The EUT is connected to a support laptop via a USB cable with ferrite on the EUT end.

The device is operating at rated 5V DC from the USB port of the laptop, Transmit and receive simultaneously.

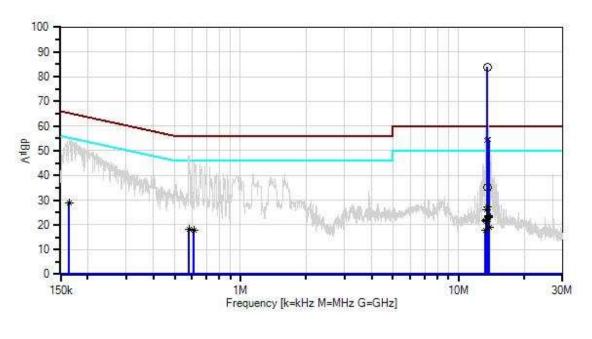

AC Conducted emission performed at AC main of the support Laptop Power supply

TX 0n, reading at fundamental measured with antenna, and with load attached.

Test Location: CKC Laboratories, Inc • 110 N. Olinda Place • Brea, CA 92821 • 714 993 6112

Customer: Magtek Incorporated

Specification: 15.207 AC Mains - Quasi-peak

Work Order #: 99423 Date: 9/25/2017
Test Type: Conducted Emissions Time: 10:49:40
Tested By: E. Wong Sequence#: 11

Software: EMITest 5.03.11 Sequence... 110V 60Hz

**Equipment Tested:** 

=quipilient resteur				
Device	Manufacturer	Model #	S/N	
Configuration 3				

Support Equipment:

Device	Manufacturer	Model #	S/N	
Configuration 3				

#### Test Conditions / Notes:

The EUT containing a 13.56 MHz transmitter and single modular approved WiFi transmitter is placed on the test bench.

WiFi Module FCCID: 07P-362 IC:10147A-362

Evaluation of 13.56MHz transmitter

TX Frequency:13.56MHz

The manufacturer declares the highest EUT frequency generated or used, other than the fundamental frequency, is 12MHz

Frequency range of measurement = 150kHz-30MHz. 150 kHz-30 MHz; RBW=9 kHz, VBW=9kHz

Test environment conditions: 23°C, 45% relative humidity, 100.8kPa

The EUT is connected to a support laptop via a USB cable with ferrite on the EUT end.

The device is operating at rated 5V DC from the USB port of the laptop, Transmit and receive simultaneously.

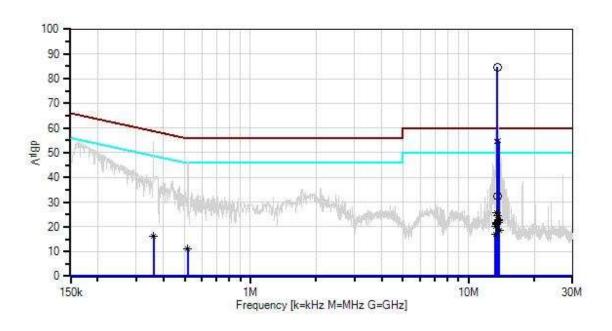

AC Conducted emission performed at AC main of the support Laptop Power supply

TX 0n, reading at fundamental measured with antenna, and with load attached.

# **Test Setup Photos**

Page 34 of 36 Report No.: 99423-19

## SUPPLEMENTAL INFORMATION

### **Measurement Uncertainty**

Uncertainty Value	Parameter
4.73 dB	Radiated Emissions
3.34 dB	Mains Conducted Emissions
3.30 dB	Disturbance Power

Uncertainties reported are worst case for all CKC Laboratories' sites and represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2.

Compliance is deemed to occur provided measurements are below the specified limits.

### **Emissions Test Details**

#### **TESTING PARAMETERS**

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

#### **CORRECTION FACTORS**

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in  $dB\mu V/m$ , the spectrum analyzer reading in  $dB\mu V$  was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

	SAMPLE CALCULATIONS										
	Meter reading	(dBμV)									
+	Antenna Factor	(dB/m)									
+	Cable Loss	(dB)									
-	Distance Correction	(dB)									
-	Preamplifier Gain	(dB)									
=	Corrected Reading	(dBμV/m)

#### **TEST INSTRUMENTATION AND ANALYZER SETTINGS**

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz
RADIATED EMISSIONS	1000 MHz	>1 GHz	1 MHz

#### SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

#### Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

#### **Quasi-Peak**

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

#### **Average**

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point, the measuring device is set into the linear mode and the scan time is reduced.
